

# Breast cancer-fighting innovation with SGRT

**At MHP Radiation Oncology Institute, we're advancing the way your patients experience treatment.**

Surface Guided Radiation Therapy (SGRT) supports unique body positioning technologies to enable:

- **Submillimeter accuracy** using 3-dimensional stereo camera units and skin surface tracking to detect slight movements and automatically pause treatment if your patient shifts.
- **Tattoo free treatments** for breast cancer patients.
- **Protection of the heart** for patients with left-sided breast cancer when using the Deep Inspiration Breath Hold (DIBH) technique.
- **Reduces risk of side effects** by precisely delivering the required dose of radiation to the disease while motion management ensures doses to surrounding tissue is limited.
